## Experiment No: 9

**Student Name:** Arpit Anand

**UID:** 23BCS12710

**Branch:** BE-CSE

**Section/Group:** KGR-3(A)

**Semester:** 5th

**Subject Name:** DAA

**Subject Code:** 23CSH-301

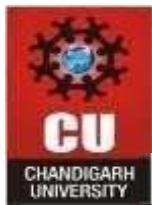

**Date of Performance:** 27<sup>th</sup> Oct, 2025

**Aim:** Develop a program and analyze complexity to find shortest paths in a graph with positive edgeweights using Dijkstra's algorithm.

**Objective:** Code and analyze to find shortest paths in a graph with positive edge weights using Dijkstra's.

### Procedure/Algorithm/Pseudocode:

1. Algorithm: Dijkstra's Algorithm
2. Input: A weighted graph  $G(V, E)$  with non-negative edge weights and source vertex  $s$ .  
Initialize:
  3. Set distance  $\text{dist}[v] = \infty$  for all vertices  $v$ , except  $\text{dist}[s] = 0$ .
  4. Mark all vertices as unvisited.
5. Repeat until all vertices are processed:
  6. Select the unvisited vertex  $u$  with the smallest distance value.
  7. Mark  $u$  as visited.  
For each neighbor  $v$  of  $u$ , update:
    8.  $\text{dist}[v] = \min(\text{dist}[v], \text{dist}[u] + \text{weight}(u, v))$ .
9. The array  $\text{dist}[]$  now contains the shortest distances from the source to all vertices..

Code:

```
package DP;

import java.util.*;

public class DijkstraAlgorithm {

    public static void dijkstra(int V, int[][] graph, int src) {
        int[] dist = new int[V];
        boolean[] visited = new boolean[V];

        Arrays.fill(dist, Integer.MAX_VALUE);
        dist[src] = 0;

        PriorityQueue<int[]> pq = new PriorityQueue<>(Comparator.comparingInt(a -> a[1]));
        pq.offer(new int[]{src, 0});

        while (!pq.isEmpty()) {
            int[] node = pq.poll();
            int u = node[0];

            if (visited[u]) continue;
            visited[u] = true;

            for (int v = 0; v < V; v++) {
                if (graph[u][v] != 0 && !visited[v]) {
                    int newDist = dist[u] + graph[u][v];
                    if (newDist < dist[v]) {
                        dist[v] = newDist;
                        pq.offer(new int[]{v, dist[v]});
                    }
                }
            }
        }

        System.out.println("Vertex \t Distance from Source (" + src + ")");
        for (int i = 0; i < V; i++) {
            System.out.println(i + " \t\t " + dist[i]);
        }
    }

    public static void main(String[] args) {
        int V = 5;
        int[][] graph = {
            {0, 10, 0, 30, 100},
            {10, 0, 50, 0, 0},
            {0, 50, 0, 20, 10},
            {30, 0, 20, 0, 60},
            {100, 0, 0, 10, 30}
        };
    }
}
```

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
{100, 0, 10, 60, 0}  
};  
  
dijkstra(V, graph, 0);  
}  
}
```

## Output :

```
"C:\Program Files\Java\jdk-23\bin\java.exe" "  
Vertex      Distance from Source (0)  
0            0  
1            10  
2            50  
3            30  
4            60
```

## Time Complexity :

Time Complexity

$O((V + E) \log V)$

Using PriorityQueue (Min-Heap)

## Learning Outcomes:

1. Understood the concept of shortest path in weighted graphs.
2. Learned how Dijkstra's algorithm efficiently finds minimal paths.
3. Implemented the algorithm using Priority Queue (Min-Heap) in Java.
4. Analyzed time and space complexity for both matrix and adjacency list representations.
5. Gained hands-on experience in graph algorithms using Dynamic Data Structures.
